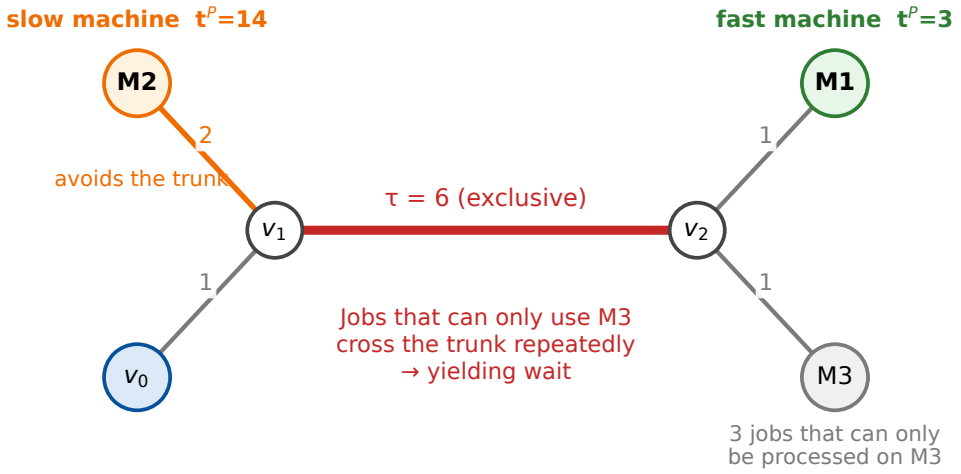
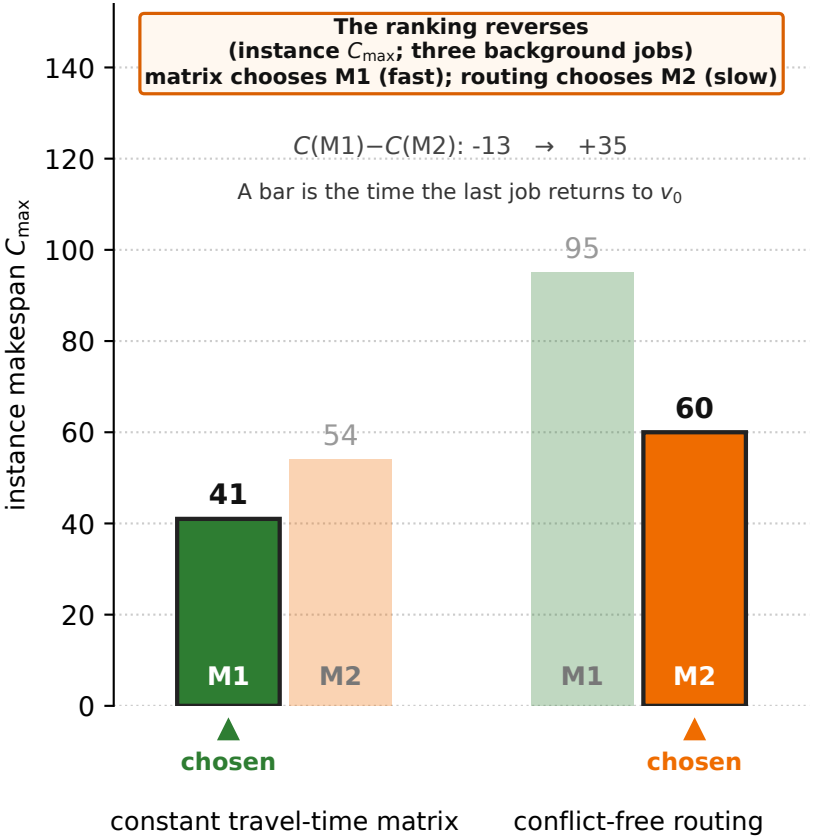
(a) The only path to the fast machine is an exclusive trunk



The job starts at the load/unload point v_0, is processed, then returns (J1 only; unimpeded, no other vehicles)
Fast machine M1: v_0--v_1--v_2--M1, one way $1+6+1=8$, round trip 16, + processing 3 $=19$
Slow machine M2: v_0--v_1--M2, one way $1+2=3$, round trip 6, + processing 14 $=20$


(b) Instance C_{max}: constant matrix vs. conflict-free routing
