

Adaptive Segmentation Strategies for T_{resch}

(a) Connected Components ($\rho_{sub} < \rho_0 = 0.3$)

Strategy: Connected Components
 Algorithm: Tarjan's SCC
 Density $\rho_{sub} = 0.136 < 0.3$
 Segments: 3 | Sizes: [4, 4, 4]
 Cross-segment edges: 0 (independent)

(b) Time-Window Partitioning ($\rho_{sub} \geq \rho_0 = 0.3$)

Strategy: Time-Window Partitioning
 Sort by $s_i^{est} = \max(r_i, \max_{t_j \in \text{Pred}_i} C_j^0)$
 Density $\rho_{sub} = 0.303 \geq 0.3$
 Segments: 4 | Size per window: 3
 Cross-segment edges: 8

— Intra-window edge
 - - Cross-window edge (coupling)
