

Our Solution: Hybrid Dynamic Programming (HDP) — Decompose → Coordinate → Converge

(a) Physical Scenario

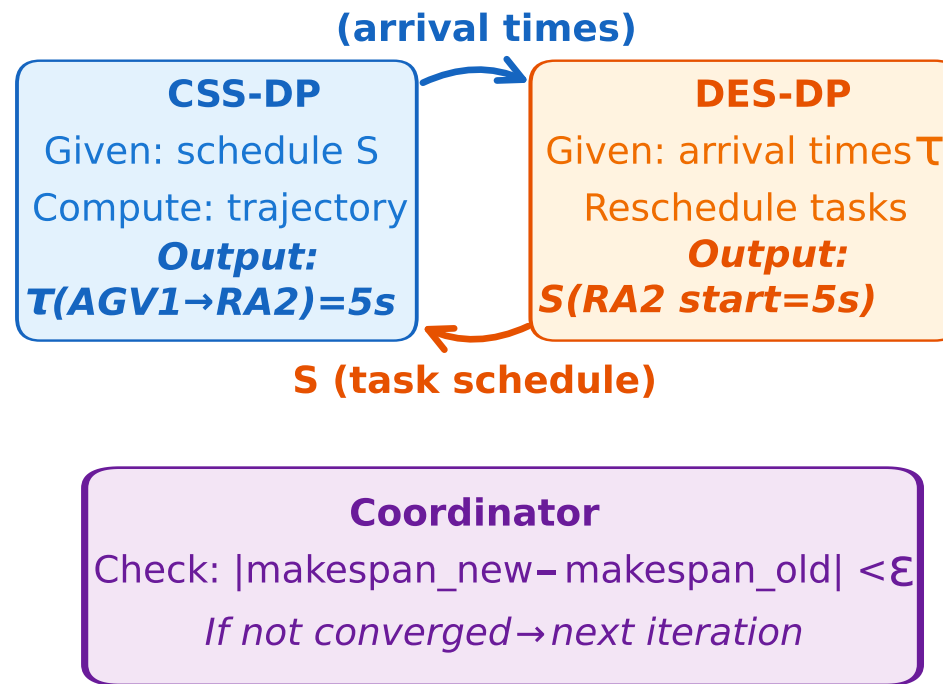

(b) Step 1: Decompose (Decouple Subproblems)

Key Insight

CSS-DP: "AGV1 can reach RA2 in 5s"
DES-DP: "RA2 is available immediately"
Solve independently, then coordinate

(c) Step 2: Coordinate (Iterative Variable Exchange)

(d) Step 3: Converge Achieved
