

(a) operation-precedence graph G_T (vertex = operation) (b) reservation dependency graph G_R (vertex = corridor occupancy)

$T_{\text{direct}} = \emptyset$

vertex set disjoint from the corridor occupancies

seed occupancies non-empty; successors collected along four edge kinds

the impact set is the transitive closure on this graph, not an operation neighbourhood

- yielding (same corridor, different vehicles)
- same-vehicle successor
- same-job successor
- - same-machine successor
